

Data sheet

Drycoat Joint Strip

Nitrile rubber tape with non-woven fabric

PRODUCT

Drycoat Joint Strip is a polyester / polyamide fibre fleece with a 0.4 mm thick nitrile rubber strip. The fleece protrudes approximately 2.5 cm on both sides of the strip. It is used to create an impregnation stop and to prevent adhesion of the waterproofing resin to the edges when applied in a joint.

USES

Drycoat Joint Strip is used as a support layer for the creation of a loop in settlement joints.

APPLICATION

Drycoat Joint Strip is used in conjunction with Drycoat PMMA systems for the creation of loops in settlement joints. Bond the protruding fleece to the edges of the joints with Drycoat Stucco, and lay the nitrile rubber strip in the joint as a loop. Then lay the Drycoat non-woven fabric, saturated with Drycoat Detail, on the Drycoat Joint Strip as a loop in the joint and form the joint according to the relevant processing guidelines.

SUPPLY

10 meters rolls.
12 cm x 10 m
15 cm x 10 m
20 cm x 10 m

STORAGE

Drycoat Joint Strip in a cool, dry enclosed space.
